

Machine-Generated Patent Documents

Presented to WIPO Conversation on IP
& Frontier Technologies

on April 6th, 2022

Ian C. Schick
Ph.D., Esq.

Growing Demand for Patent Services

- Over the last decade:
 - **31% increase** → total patent applications filed per year (2008-2018)
 - **40% increase** → total substantive official actions mailed per year (2007-2017)

US patent filings versus Moore's Law

Annual patent filings leveling off or set to increase drastically?

Substantive Official Actions Mailed per Year

Practitioner demand at all-time highs

Changing Demographics Within the Patent Bar

- Patent bar admissions have largely collapsed over the last decade

Challenging Economics for Prep & Pros

- Decade-long decline in market-rate fees for patent services
 - **34% decrease** → inflation-adjusted average fees to prep and file a software app
 - Is this a trend that will continue?

Economic Non-Equilibrium Driving Innovation

Demand

Measured by
annual filings

Supply

Measured by #
of practitioners

Price

Measured by
average fees

Can NLP/NLG help bring market closer to equilibrium?

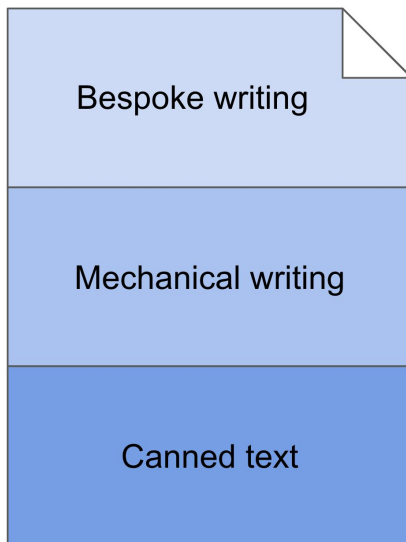

To what extent can computers generate patent docs?

What does this mean for attorneys and consumers?

Content Types in Legal Documents

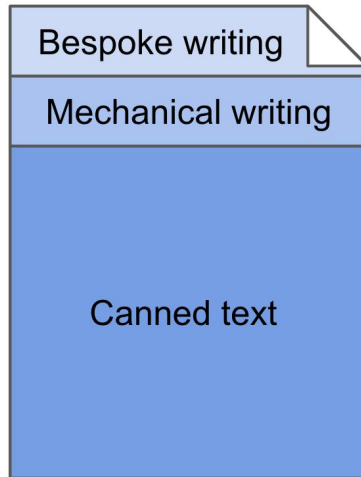

- Decompose legal documents based on “type of content”

Legal Document:

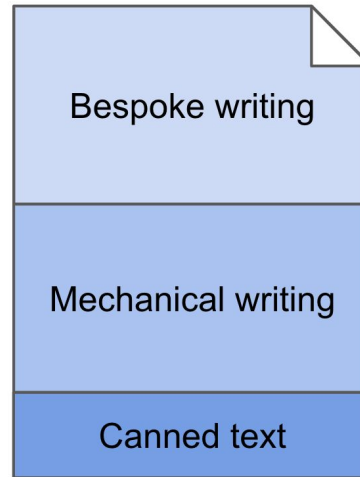

Different Legal Docs Have Different Content Ratios

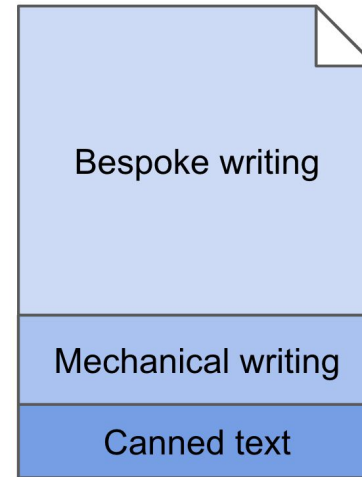

- Type of content determines approach for document automation

Contract

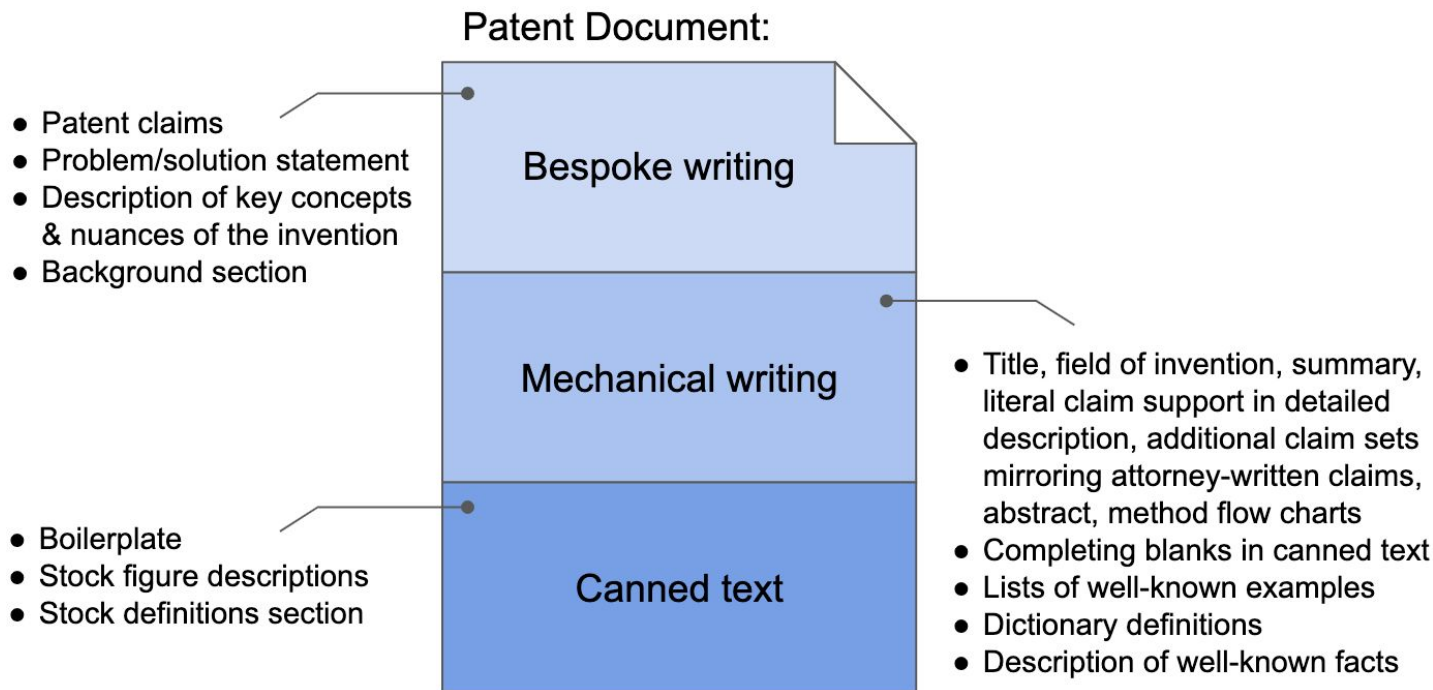

Brief

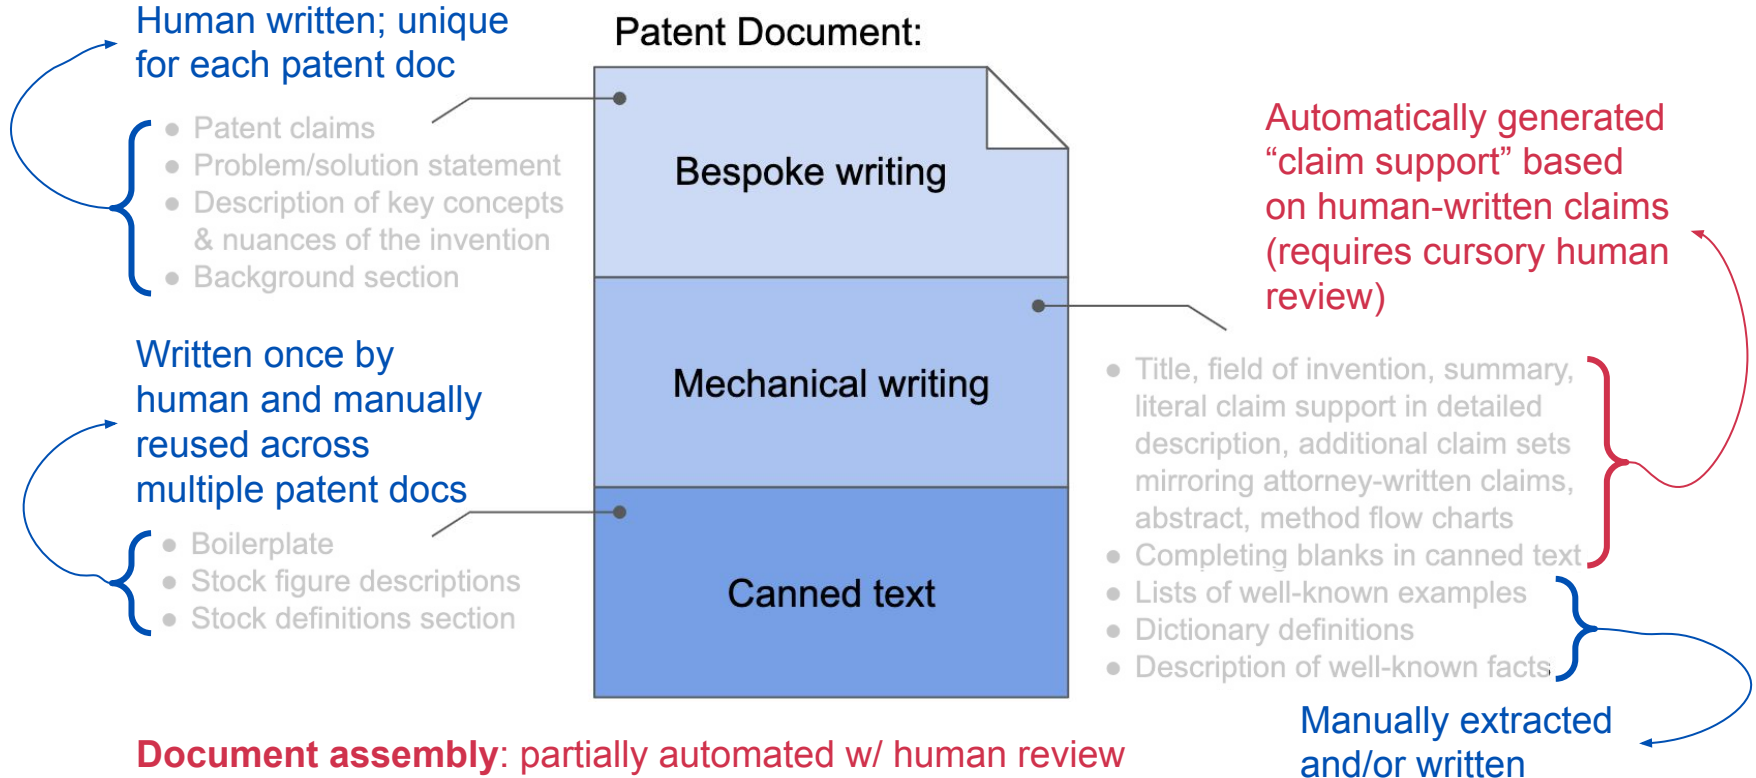

Memorandum

Example: Patent Application Documents

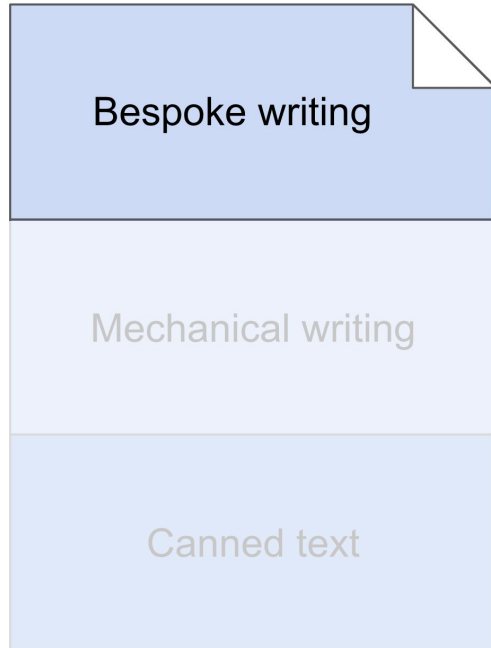

Example: Patent Application Documents (SOTA)

What's Next: Bespoke Writing Content

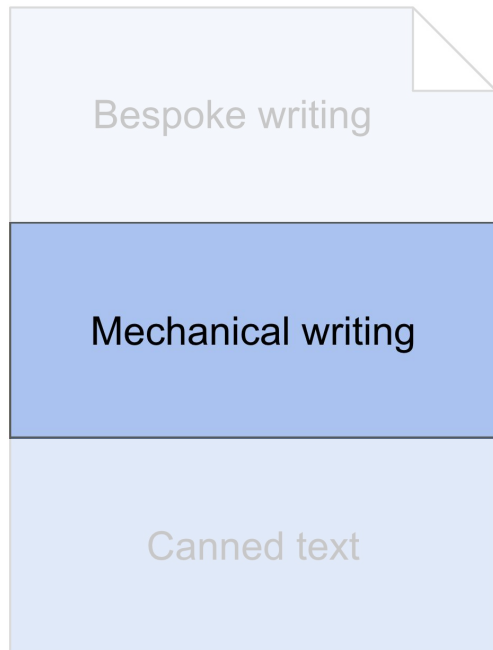

Legal Document:

- **Accelerate human ability** to write & edit bespoke content
 - **Predictive text**, e.g., suggested sentence completions
 - **Dynamic documents**, e.g., when term is changed and same change propagates through entire document or if a figure element is renumbered/renamed, corresponding changes are made throughout the document

What's Next: Mechanical Writing Content

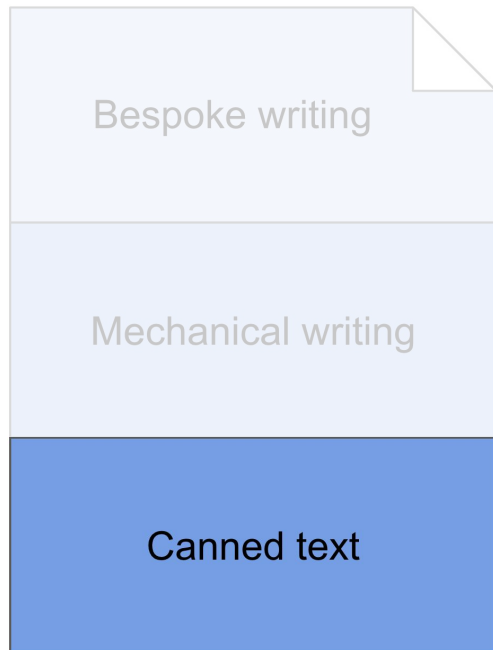

Legal Document:

- **More documents** will be identified for mechanical writing automation
 - High value, high volume, substantial mechanical writing involved
- **Improve readability** of auto-generated mechanical writing content
 - **Enhance transduction** of input language
 - **Increase variety** in surface realization

What's Next: Canned Text Content

Legal Document:

- **Add automation** to canned text utilization
 - **Automate extraction** of boilerplate and other reused content
 - **Automate suggestion or selection** of appropriate boilerplate
 - **Language sync / doc assembly**, i.e., putting the pieces together in a beautifully formatted document with self-consistent language

Expectations

For high-value / high-volume patent documents:

1. Absent general AI, automation will not displace attorneys in patent document preparation
2. The highest value “bespoke” writing will remain the purview of skilled patent attorneys
3. Rote & mundane parts of patent drafting are being automated away (and they won't be missed)

Impact of Auto-Drafted Patent Documents

For Attorneys:

1. Better job satisfaction: More time spent on interesting work and less on dull work
2. Better value to clients: More time in budget to spend on analysis and bespoke writing
3. Better value to law firms: Each attorney can process more work in less time w/o sacrificing quality

For Consumers:

1. Improved accessibility: Lower document costs means more consumers can use patent services
2. Improved quality: Automation acts as guardrails reducing human errors in work product
3. Faster turnaround: Legal services can keep up with the pace of their clients' businesses
