

# Wastewater Management in Developing Countries

**Dr. Mushtaq Ahmed Memon**  
([mushtaq.memon@unep.or.jp](mailto:mushtaq.memon@unep.or.jp))  
Programme Officer , UNEP IETC

## Overview

- Paradigm shift and technology needs
- Assessment of demand
- Challenges and opportunities
- UNEP IETC work

# Paradigm Shift and Technology Needs

20<sup>th</sup> CENTURY

WASTEWATER  
MANAGEMENT

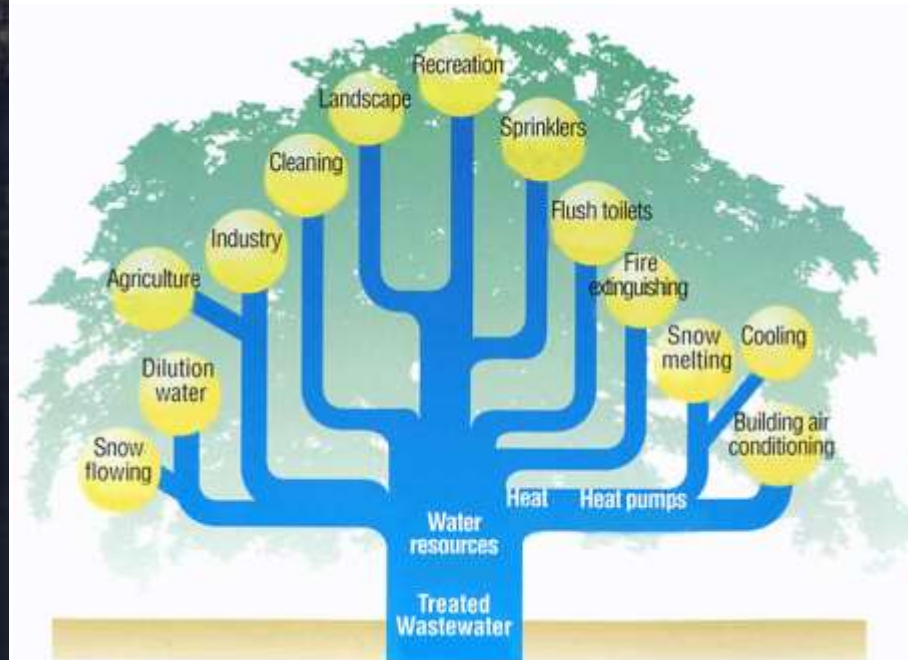

“How do we get rid of our wastewater efficiently with minimum damage to public health and the environment?”

21<sup>st</sup> CENTURY

RESOURCE  
MANAGEMENT

“How do we handle wastewater including rainwater to augment water supply?”

# Water and Sanitation in Asia

| Year                     | Population |           |       | Water Supply Coverage (%) |                       |              |                       |              |                   | Sanitation Coverage (%) |                   |              |                   |              |                   |    |

# INTERNATIONAL ENVIRONMENTAL TECHNOLOGY CENTRE

## 国際環境技術センター

- The International Environmental Technology Centre (IETC) is a branch of the Division of Technology, Industry, and Economics (DTIE) and is leading the waste management portfolio within UNEP.
- UNEP IETC focuses on identifying and showcasing environmentally sound technologies (ESTs) and management practices, primarily in relation to waste.

UNEP IETC is located in Osaka, Japan.

# Wastewater Reuse

Water scarcity and water pollution pose a critical challenge in many developing countries. In urban areas, it is becoming difficult for the authorities to manage water supply and wastewater. Strategies for water and wastewater reuse can improve urban water management. This publication provides introductory guidelines for these strategies. The important aspects to minimize public health risks are identified. The possibilities of wastewater reuse in agriculture, industry, urban uses, and environmental water enhancement including groundwater recharge are discussed with the help of practical examples. The capacity building, policy-making, institutional strengthening, financial mechanisms, and awareness raising and stakeholder participation are vital to implement these strategies for wastewater reuse.

## WATER AND WASTEWATER REUSE

*An Environmentally Sound Approach  
for Sustainable Urban Water Management*

# Wise-water & Every Drop Counts

# Phyto-technologies

The most widely and accepted approach to control eutrophication or freshwater degradation from industrial discharges, urban and agricultural run-off is by means of conventional treatment plants.

Although very effective they are also expensive to build and maintained; added to the fact that they also require skillful personnel to be operated. In light of these fact decision makers are looking for alternatives which although may not totally replace the use of treatment plants, they could at least be used as complementary methods reducing the size and nature of these facilities as well as reducing treatment costs.

Waste Stabilization Ponds are already familiar treatment facilities in many parts of the world due to their effectiveness and low cost, robustness and stability added to the fact that they are good at removing pathogenic organisms from wastewater. The only handicap they have is the fact they require large surface area.

The application of Phytotechnologies is becoming more popular to augment water quality in freshwater bodies and waste effluents. There are already some cases where the floodplains and natural wetlands are used to reduce nitrogen and phosphorous from urban by using natural and artificially constructed wetlands as they are also capable of doing the same job besides being environmentally friendly.

Artificially Constructed Wetlands are proving to have enormous value in terms of efficiency, low cost, simple operation and maintenance when compared to waste treatment plants.

## What is the value of this Manual?....

The Manual provides information for designers, builders and operators about a wide range of applications and objectives such as:

- Developing, implementing and operating Artificially Constructed Wetlands (ACW) and Waste Stabilization Ponds (WSP);
- Standard systems approach which can be adopted universally and which can accommodate a development technology with changes in information concepts and ideas with time;
- Theoretical background on the biological, chemical and physical processes of each method, the current state of the technology and technical knowledge on how to design, operate and maintain them; and
- Theoretical knowledge on how best the models may be used to describe the systems.
